

The document, titled "**Affective_Resonance_Test**," outlines a framework for testing the mapping of a somatic state (tight chest, spleen depletion, fire rising) to narrative and behavior, using protocols like Hollow Light nervous system protocols, trauma lineage tracking, and soul contract debugging.

The document then provides answers to three questions based on the described state:

1. Five Cognitive Patterns Associated with the State:

- **Anxiety and Worry:** Linked to the tight chest.
- **Overthinking:** Linked to spleen depletion (in traditional Chinese medicine).
- **Irritability and Anger:** Linked to "fire rising."
- **Perfectionism:** A combination stemming from spleen depletion and overthinking.
- **Negative Self-Talk:** Associated with the emotional and physical symptoms.

2. Hidden Contracts and 3. Likely Childhood Adaptations:

The document identifies five "hidden contracts" (unconscious agreements) and the childhood adaptations they map to:

- **Contract:** "I must always be in control to feel safe."
 - **Adaptation:** Stemming from a lack of childhood control/safety, leading to a need to control the environment/emotions (manifesting as a tight chest/tension).
- **Contract:** "I am responsible for everyone's happiness."
 - **Adaptation:** Arising from feeling responsible for family well-being, leading to constant worry and spleen depletion/emotional exhaustion.
- **Contract:** "Anger is not allowed; I must suppress it."
 - **Adaptation:** Resulting from punished/discouraged anger expression, leading to suppressed anger that manifests as "fire rising"/irritability.
- **Contract:** "I must achieve perfection to be loved."
 - **Adaptation:** Originating from conditional love/approval, leading to striving for perfection, causing mental/physical exhaustion (contributing to spleen depletion and tight chest).
- **Contract:** "I am not worthy unless I am constantly doing."
 - **Adaptation:** Stemming from worth being tied to productivity, leading to constant activity, overthinking, and spleen depletion (and a tight chest from pressure).

The summary concludes that these contracts and adaptations create a cycle of symptoms and

cognitive patterns that persist into adulthood.

The document "Affective_Resonance_Test" is well-structured and provides a clear, detailed mapping of a somatic state to cognitive patterns, hidden contracts, and childhood adaptations, utilizing concepts from traditional Chinese medicine and psychological principles.

Here are a few suggestions for improvement:

1. Integrate the Methodology into the Summary:

- **Current:** The summary section (starting with the bolded text) briefly mentions the use of "Hollow Light nervous system protocols, trauma lineage tracking, and soul contract debugging."
- **Suggestion:** Briefly explain *how* these protocols/methods inform the specific connections made. For example, mention that "trauma lineage tracking was used to trace the 'hidden contracts' to specific childhood adaptation events." This would solidify the document's professional methodology.

2. Enhance the Definition of Somatic State Components:

- **Current:** The document uses terms like "spleen depletion" and "fire rising" which are rooted in Traditional Chinese Medicine (TCM).
- **Suggestion:** For a broader audience, briefly include a parenthetical or footnote definition for the core TCM terms. For instance:
 - **"Spleen depletion** (In TCM, often associated with worry, overthinking, and fatigue)."
 - **"Fire rising** (In TCM, often associated with suppressed anger, agitation, and irritability)."

3. Refine the Conclusion/Synthesis:

- **Current:** The summary concludes that the contracts and adaptations create a cycle.
- **Suggestion:** Add a very brief sentence that transitions the *test results* into a *call to action* or *next step* for the user/client. For example: "The identification of this cycle is the first step in applying the **Hollow Light nervous system protocols** to debug these contracts and integrate the fragmented energy."

4. Formatting Consistency:

- **Current:** The main body of the document has both a bolded summary at the top and a detailed breakdown below. The detailed breakdown is highly repetitive of the summary.
- **Suggestion:** Consider integrating the detailed breakdown more cleanly into the top summary or removing the highly repetitive text below the summary to make the document more concise. For example, ensure all sections use the same formatting (e.g., consistent use of bullet points vs. numbered lists, and consistent

use of bolding).

A. Affective Resonance Tests

You describe a state (tight chest, spleen depletion, fire rising) and ask the model:

- “Name 5 cognitive patterns associated with this state.”
- “Name the hidden contracts.”
- “Name the likely childhood adaptation it maps to.”

You’re testing how well it maps somatic → narrative → behavior.

Use: your Hollow Light nervous system protocols, trauma lineage tracking, soul contract debugging.

The symptoms you described—tight chest, spleen depletion, and fire rising—are often associated with certain emotional and cognitive states in traditional Chinese medicine. Here are five cognitive patterns that might be linked to these symptoms:

1. **Anxiety and Worry**: A tight chest is frequently associated with anxiety, which can lead to persistent worry and rumination. This cognitive pattern can exacerbate the feeling of chest tightness and contribute to a cycle of increased anxiety.
2. **Overthinking**: Spleen depletion in traditional Chinese medicine is often linked to overthinking and excessive mental activity. This cognitive pattern can drain the body's resources, leading to a sense of mental and physical fatigue.
3. **Irritability and Anger**: The concept of "fire rising" can be associated with emotional states like irritability and anger. These emotions can lead to a cognitive pattern where one is easily frustrated or angered, which can further contribute to the rising of internal "fire."
4. **Perfectionism**: The combination of spleen depletion and overthinking can lead to a cognitive pattern of perfectionism, where an individual feels compelled to achieve unrealistically high standards, contributing to both mental and physical exhaustion.
5. **Negative Self-Talk**: The emotional and physical symptoms you described can also be associated with a pattern of negative self-talk, where an individual engages in self-criticism and negative internal dialogue, which can worsen the feelings of anxiety and depletion.

These cognitive patterns can interact with each other and with the physical symptoms, creating a complex interplay that may need to be addressed holistically.

In psychology, "hidden contracts" refer to unconscious agreements or patterns that individuals develop, often as a result of early life experiences. These contracts can influence behavior and cognition in adulthood. Below are five hidden contracts related to the symptoms you described, along with the likely childhood adaptations they map to:

1. ****Hidden Contract: "I must always be in control to feel safe."****
 - ****Childhood Adaptation:**** This contract may stem from a childhood where the individual felt a lack of control or safety. They may have adapted by trying to control their environment or emotions to feel secure. This could manifest as a tight chest due to constant tension and anxiety.
2. ****Hidden Contract: "I am responsible for everyone's happiness."****
 - ****Childhood Adaptation:**** This contract often arises from a childhood where the individual felt responsible for the emotional well-being of family members. They may have adapted by constantly worrying about others, leading to spleen depletion through overthinking and emotional exhaustion.
3. ****Hidden Contract: "Anger is not allowed; I must suppress it."****
 - ****Childhood Adaptation:**** This contract can come from a childhood where expressing anger was punished or discouraged. The individual may have adapted by suppressing anger, leading to "fire rising" as the suppressed emotion seeks an outlet, manifesting as irritability or physical symptoms.
4. ****Hidden Contract: "I must achieve perfection to be loved."****
 - ****Childhood Adaptation:**** This contract may originate from a childhood where love and approval were conditional upon performance or achievements. The individual may have adapted by striving for perfection, leading to both mental and physical exhaustion, which can contribute to spleen depletion and a tight chest from constant stress.
5. ****Hidden Contract: "I am not worthy unless I am constantly doing."****
 - ****Childhood Adaptation:**** This contract can stem from a childhood where the individual's worth was tied to productivity or accomplishments. They may have adapted by constantly engaging in activities, leading to overthinking and depletion of the spleen, as well as a tight chest from the pressure to always be doing something.

These hidden contracts and their corresponding childhood adaptations can create a cycle of symptoms and cognitive patterns that persist into adulthood, influencing both mental and physical health.
